CATALOGUE OF THE FRESH-WATER FISHES OF TROPICAL AND SOUTH TEMPERATE AMERICA.*

BY

C. H. EIGENMANN.

IN the following list are enumerated the orders, families, genera and species of fishes inhabiting the fresh waters of the West Indies, South America, and Middle America south of a line joining the Rio Panuco on the east and the Rio Presidio near Mazatlan on the west. The list attempts to be complete to June, 1909.†

Under each genus will be found the synonyms and the type of the genus, and the total range of its species. The range will be the sum of the distributions of the species enumerated, except in cases of genera having extralimital species.

Under each species are given its synonyms and the geographical distribution.

Opposite each species, except in the case of the Characins and species dealt with in the Patagonian section of this work, will be given a reference which will connect this work with the literature on the species.

A catalogue of the fresh-water fishes of South America was published by Eigenmann and Eigenmann in the Proceedings of the United States National Museum, 1891, and a catalogue of the Middle American species in the same serial for 1892. Free use has been made of these catalogues. The task of bringing the work down to date has been greatly lessened by the following works of recent years:

Jordan & Evermann, Fishes of North and Middle America. Bull. U. S. Nat. Mus., 47, Washington, 1896-1898.

* This catalogue forms the third part of "The Fresh-Water Fishes of Patagonia and an Examination of the Archiplata-Archhelenis Theory" and is a reprint from the "Reports of the Princeton University Expeditions to Patagonia, 1896-1899," Vol. III, pp. 375-511.

† The entire MS. was completed to 1906. Delay in publication has enabled me to bring the catalogue down to June, 1909. In consequence of bringing the catalogue down to 1909 some discrepancies between the preceding and following lists of species will be found. An especially large number of additions are made to the Characins and the fauna of Guiana.

These papers, exclusive of the MS. monograph on the Characidæ, are referred to under the name of the author and the page. Other papers are quoted by the author, year of publication and the page. The full titles may readily be found in the bibliography at the end of the Catalogue.

All fishes recorded from fresh water are enumerated. In tropical America many marine species enter fresh water. Some of these do not go far beyond the mouths of rivers, others ascend streams several thousand miles. Perhaps some of the marine species enumerated should have been excluded, probably others should have been added. The author will be very glad to be informed of any omissions or errors of any sort.

In order to emphasize the Pacific slope fauna the species from this area are in heavy type. To readily distinguish the Amazonian species, these are preceded by an A.

I, 7-I, 9, and *Macropteri*, D. I, 11-I, 13.Gill (1859) separated the *Macropteri* under the name *Pterygoplichthys*, saying: "The genus *Ancistrus* seems to have been framed with special regard to those fishes to which the name is here restricted, and is by Dr. Kner divided into two sections, which correspond to *Ancistrus* and *Pterygoplichthys*, his section *a* answering to the former genus and *b* to the latter."The species known to Kner and included in his *Brachypteri* are: *Hypostomus cirrhosus* C. & V., *Ancistrus dolichopterus* Kner, *Ancistrus gymnorhynchus* Kner, *Ancistrus mystacinus* Kner, *Ancistrus pictus* Kner, *Ancistrus brachyurus* Kner, *Ancistrus scaphirhynchus* Kner. it, but as he described or redescribed all of the other genera of fresh-water fishes from Trinidad.

His description of *Ancistrus* was either drawn from his specimens of *guacharote* or from Cuvier & Valenciennes's (XV, 508) description of *guacharote*. *Guacharote* was known to Kner only through C. & V.'s description and on account "der Ungenauigkeit der Beschreibung", he was unable to place it with certainty. He thought it might be his *mystacinus*.Regan considers *guacharote* as belonging to his new subgenus *Lasiancistrus*. But because Gill's wording of the description applies only to *brachyurus* and *scaphirhynchus* (and *medians*) of Kner, Regan considers the latter typical of *Ancistrus*. Gill's diagnosis based on *guacharote*, a species not known to Kner and at least subgenerically distinct from *brachyurus* and *scaphirhynchus*, can have no bearing whatever on the restriction of *Ancistrus*.Fortunately Bleeker definitely restricted the name to Kner's first species, *cirrhosus*.

¹ In a recent paper (The Gymnotidæ, Proc. Wash. Acad. Sci., VII, p. 174) I followed Gill in using the name *Gymnotus* for the current *Gymnotus carapo* Linnæus, this species being the only one described by Linnæus in his tenth edition. No doubt seems to have been entertained about the nature of the *Gymnotus carapo* of Linnæus and its supposed synonymy and bibliography were given in the paper quoted above, p. 175.

Mr. Lönnberg has kindly called my attention to his paper (Bihang till K. Svenska Vet.-Akad. Handb., XXII, Afd. IV, 23, 1896) on Linnean Type-specimens in which he has shown that the type of Linnæus is not the current *Gymnotus carapo*, but the *Gymnotus fasciatus* of Pallas or *Giton fasciatus* Auct. The latter

species must therefore stand as *Gymnotus carapo* Linnæus, the name *Gymnotus* replacing the more recent *Giton*.

The current *Gymnotus carapus* must be known by its oldest name, which is *macrurus* Bloch & Schneider. Müller & Troschel in 1849 proposed the name *Sternopygus* for *macrurus*, *tumifrons*, *virescens*, *lineatus*, and *æquilabiatus*. In 1894 I selected as the type of *Sternopygus* the then current *carapo*, of which *macrurus* was a synonym. The fact that the name *carapo* of Linnæus did not refer to the species under consideration need not invalidate this restriction, since there was no doubt whatever about the fish that was intended to serve as type. It may stand as *Sternopygus macrurus* (Bloch & Schneider).

ÆQUIDENS Eigenmann & Bray.^{1,2}Type: *Acara tetramerus* Heckel.Range: Panama to the La Plata and
western Ecuador.cluded the type of Swainson's *Astronotus* under the
new name *crassispinis* and also that of *Cichlasoma*.
He did not indicate a type, and he grouped the species
as follows, describing the first thirteen in detail.

A.

Acara margarita = *Cichlasoma bimaculatum*.
Acara tetramerus = *Æquidens tetramerus*

A1. *Æquidens tetramerus* (Heckel),
Pellegrin, 135.

? *Sciæna punctata* Linnæus; *Acara vi-*
ridis, *diadema*, *pallidus* and *dimerus*

B.

Acara viridis = *Æquidens tetramerus*.
Acara diadema = *Æquidens tetramerus*.
Acara vittatus = *Æquidens vittatus*.

C.

Acara pallidus = *Æquidens tetramerus*.
Acara dorsigerus = *Æquidens dorsigerus*.
Acara marginatus = *Cichlasoma bimaculatum*.
Acara dimerus = *Æquidens tetramerus*.

D.

Acara nassa = *Acaropsis nassa*.
Acara cognatus = *Acaropsis nassa*.
Acara unicolor = *Acaropsis nassa*.

E.

Acara crassispinis = *Astronotus ocellatus*.

Heckel enumerates as other species belonging to this genus:

Acara niloticus = *Tilapia nilotica*.
Acara punctatus = *Cichlasoma punctatum*.
Acara gronovii = *Cichlasoma bimaculatum*.
Acara brasiliensis = *Geophagus brasiliensis*.
Acara tania = *Cichlasoma bimaculatum*.
Acara surinamensis = *Geophagus surinamensis*.
Acara desfontainii = *Astatotilapia desfontainii*.
Acara ocellatus = *Astronotus ocellatus*.

Inasmuch as the species described by Heckel included members of four distinct genera and since he added members of three other genera from species known to him from descriptions, we cannot say that he had any very definite thing in mind when he framed the genus.

In the generic description he refers to figures of the lower pharyngeals and gill-arches of *Acara tetramerus* and *crassispinis*.

As far as Heckel's work is concerned, his *Acara*, containing the type of Swainson's *Astronotus* (to the figure of which Heckel definitely refers in his generic description) might be a synonym of *Astronotus* or separate from it, depending altogether on which of his species, if any, he considered his type. If any presumption is permitted, it must be in favor of his first species or the last, or one of the species whose figures are referred to in his generic description. The first species is a synonym of *Sciæna bimaculata* Linnæus and belongs to the genus *Cichlasoma* of Swainson. If the first species is selected, the name *Acara* becomes a synonym of *Cichlasoma*. If the last species, *crassispinis*, is selected, *Acara* becomes a synonym of *Astronotus*,

Heckel; *Chromys punctata* and *uni-*
ocellata Castelnau.

Habitat: Essequibo; Amazons south to
Rio Janeiro and Paraguay.

since *crassispinis* is a synonym of *ocellatus*, the type of the latter genus. If one of the two species figured is selected we may have *tetramerus* or again *crassispinis* as the type for *Acara*. If the former is selected the name *Acara* will stand.

Inasmuch as Heckel does not select a type, it is incumbent on a later naturalist to select a type from among the four species discussed, or from among any of Heckel's species.

In the earliest paper by Gill (Synopsis of the Fresh-Water Fishes of Trinidad) he says, p. 19: "As it [*Labrus punctatus*, the type of *Cichlasoma*] is a true *Acara*, the latter genus is consequently synonymous with *Cichlasoma*, and in accordance with the law of priority, the Swainsonian name must be adopted as that of the present genus." Gill re-defines the genus *Cichlasoma*, excluding several of Heckel's species, and continues: "With these characters, that species which Mr. Heckel . . . has described as the *Acara crassispinis*, will also be excluded [from the genus *Cichlasoma*]; this species appears to be generically distinct from both *Cichlasoma* and from *Astronotus* of Swainson. . . . If it should be found, on a more critical examination, to be really distinct from *Astronotus*, to which it is most nearly allied, Heckel's name of *Acara* might appropriately be retained as its generic name. . . . It belongs to the section E of the genus *Acara*, in the arrangement of Heckel . . . ; the other sections . . . all belong to *Cichlasoma* as now restricted."

Gill thus removed from *Acara* all of Heckel's species but *crassispinis*.

There can be no question that it was entirely within the province of Gill to restrict the genus to this species. But it was found later that *crassispinis* is a synonym of *ocellatus*, the type of *Astronotus*. *Acara* is therefore the exact synonym of *Astronotus* and cannot be used for anything else. Inasmuch as *tetramerus* and other species are distinct from *Astronotus*, I coined the name *Æquidens* for them in 1894. (Ann. N. Y. Acad. Sci., VII, 616, using the *Acara tetramerus* Heckel as type.)

The name *Acara* has been resurrected by Regan (Ann. and Mag. Nat. Hist. (7), XV, 1905, p. 330), who says: "After removing from Heckel's genus the species which belong to *Astronotus*, *Cichlasoma* and *Acaropsis*, I use *Acara* for the remainder, regarding Gill's restriction of the name *Acara* to a species which was already the type of another genus as invalid."

I know of no rule, ancient or modern, of scientific nomenclature which authorizes anyone to regard as invalid the work done by someone else, unless that work was done contrary to the accepted canons. In fact, the rules (if I am not mistaken) have been made especially to prevent this sort of procedure.

2. *Æquidens centralis* (Holmberg),
Pellegrin, 136.
